PATENT COOPERATION TREATY

From the INTERNATIONAL SEARCHING AUTHORITY

То:	PCT		
DANIEL E. ALTMAN KNOBBE, MARTENS, OLSON & BEAR, LLP			
2040 MAIN STREET, 14TH FLOOR IRVINE, CA 92614	NOTIFICATION OF TRANSMITTAL OF THE INTERNATIONAL SEARCH REPORT AND THE WRITTEN OPINION OF THE INTERNATIONAL SEARCHING AUTHORITY, OR THE DECLARATION		
	(PCT Rule 44.1)		
	Date of mailing (day/month/year) 04 SEP 2008		
Applicant's or agent's file reference	FOR FURTHER ACTION See paragraphs 1 and 4 below		
FOUNDRY019V2	FOR TERMINENTON OUT punguspun		
International application No. PCT/US 08/60922	International filing date (day/month/year) 18 April 2008 (18.04.2008)		
Applicant THE FOUNDRY, INC.			
Apprount THE TOOMSTOTE AND			
	1 A Jake written eninion of the International Searching		
1. The applicant is hereby notified that the international s Authority have been established and are transmitted he	earch report and the written opinion of the International Searching rewith.		
Euter of amondments and statement under Article 1	9.		
The applicant is entitled, if he so wishes, to amend the When? The time limit for filing such amendme	ints is normally two months from the date of transmittal of the		
international search report.	·		
Where? Directly to the International Bureau of WI 1211 Geneva 20. Switzerland, Facsimile N	So.: +41 22 740 14 35		
For more detailed instructions, see the notes on the	e accompanying sheet.		
2. The applicant is hereby notified that no international search report will be established and that the declaration under Article 17(2)(a) to that effect and the written opinion of the International Searching Authority are transmitted herewith.			
	dditional fee(s) under Rule 40.2, the applicant is notified that:		
the anatost together with the decision thereon	has been transmitted to the International Bureau together with the the protest and the decision thereon to the designated Offices.		
no decision has been made yet on the protest; the applicant will be notified as soon as a decision is made.			
4. Reminders	the state of the second st		
Shortly after the expiration of 18 months from the priority date, the international application will be published by the International Bureau. If the applicant wishes to avoid or postpone publication, a notice of withdrawal of the international application, or of the priority claim, must reach the International Bureau as provided in Rules 90bis.1 and 90bis.3, respectively, before the completion of the technical preparations for international publication.			
The applicant may submit comments on an informal basis on the written opinion of the International Searching Authority to the International Bureau. The International Bureau will send a copy of such comments to all designated Offices unless an international preliminary examination report has been or is to be established. These comments would also be made available to the public but not before the expiration of 30 months from the priority date.			
Within 19 months from the priority date, but only in respect of some designated Offices, a demand for international preliminary examination must be filed if the applicant wishes to postpone the entry into the national phase until 30 months from the priority date (in some Offices even later); otherwise, the applicant must, within 20 months from the priority date, perform the prescribed entry into the national phase before those designated Offices.			
In respect of other designated Offices, the time limit of 30	months (or later) will apply even if no demand is filed within 19		
months. See the Annex to Form PCT/IB/301 and, for details about th Guide, Volume II, National Chapters and the WIPO Internet	e applicable time limits, Office by Office, see the PCT Applicant's site.

WRITTEN OPINION OF THE INTERNATIONAL SEARCHING AUTHORITY

International application No.

PCT/US 08/60922

Box	No. I	Basis of this opinion
1.	With r	regard to the language, this opinion has been established on the basis of:
	X	the international application in the language in which it was filed.
		a translation of the international application into which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1(b)).
2.		This opinion has been established taking into account the rectification of an obvious mistake authorized by or notified to this Authority under Rule 91 (Rule 43bis.1(a))
3.	With a	regard to any nucleotide and/or amino acid sequence disclosed in the international application, this opinion has been ished on the basis of:
	a. ty	pe of material
	Ļ	a sequence listing
	L	table(s) related to the sequence listing
	h fo	rmat of material
		on paper
		in electronic form
	c. tii	me of filing/furnishing
	L	contained in the international application as filed filed together with the international application in electronic form
	_ 	furnished subsequently to this Authority for the purposes of search
	<u> </u>	
4.		In addition, in the case that more than one version or copy of a sequence listing and/or table(s) relating thereto has been filed or furnished, the required statements that the information in the subsequent or additional copies is identical to that in the application as filed or does not go beyond the application as filed, as appropriate, were furnished.

WRITTEN OPINION OF THE INTERNATIONAL SEARCHING AUTHORITY

International application No.
PCT/US 08/60922

Supplemental Box

In case the space in any of the preceding boxes is not sufficient.

Continuation of: Box V(2) Citations and explanations:

As per claim 12, Pearson teaches a method of creating a lesion in a target tissue layer in the absence of cooling (para [0156]--"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue"), wherein the target tissue layer is below a first tissue layer, the first tissue layer being adjacent to a skin surface (para [0197]--"Embodiments of the invention can be configured for the treatment of tumor and tissue masses at or beneath a tissue surface in a number of organs"--skin is a tissue), the method comprising the steps of: irradiating the target tissue layer and a first tissue layer through a skin surface with electromagnetic energy (para [0004]--"An embodiment of the invention provides an impedance controlled tissue ablation apparatus and method that utilizes impedance determinations, such as localized tissue impedance to optimize the delivery of radio-frequency or other electromagnetic energy to a target tissue site") having predetermined frequency and electric field characteristics (para [0156]--"Lower electromagnetic frequencies such as RF frequencies (e.g. 1 kHz to 1 MHZ) produce a more localized energy concentration (e.g. current density), wherein the first tissue layer is above the target tissue layer, the first tissue layer being adjacent to a surface of the skin (para [0197]--"Embodiments of the invention can be configured for the treatment of tumor and tissue masses at or beneath a tissue surface in a number of organs"--skin is a tissue); and generating a power loss density profile, wherein the power loss density profile has a peak power loss density in a region of the target tissue layer (para [0147]--"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode").

As per claim 13, Pearson teaches a method of generating heat in a target tissue layer wherein the heat is sufficient to create a lesion in or proximate to the target tissue layer (para [0156]—"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue"), wherein the target tissue layer is below a first tissue layer, the first tissue layer being adjacent to a skin surface (para [0197]—"Embodiments of the invention can be configured for the treatment of tumor and tissue masses at or beneath a tissue surface in a number of organs"--skin is a tissue), the method comprising the steps of: irradiating the target tissue layer and the first tissue layer through the skin surface with electromagnetic energy (para [0004]—"An embodiment of the invention provides an impedance controlled tissue ablation apparatus and method that utilizes impedance determinations, such as localized tissue impedance to optimize the delivery of radio-frequency or other electromagnetic energy to a target tissue site") having predetermined frequency and electric field characteristics (para [0156]—"Lower electromagnetic frequencies such as RF frequencies (e.g. 1 kHz to 1 MHZ) produce a more localized energy concentration (e.g. current density); and generating a power loss density profile wherein the power loss density profile has a peak power loss density in a region of the target tissue layer (para [0147]—"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode").

As per claim 14, Pearson teaches a method of generating heat in a target tissue layer in the absence of cooling wherein the heat is sufficient to create a tissue effect in or proximate to the target tissue layer (para [0059]..."various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue"), wherein the target tissue layer is below a first but only in the affected tissue layer being adjacent to a skin surface (para [0197]--"Embodiments of the invention can be configured for the treatment of tumor and tissue masses at or beneath a tissue surface in a number of organs".--skin is a tissue), the method comprising the steps of: irradiating the target tissue layer and the first tissue layer through the skin surface with electromagnetic energy (para [0004]--"An embodiment of the invention provides an impedance controlled tissue ablation apparatus and method that utilizes impedance determinations, such as localized tissue impedance to optimize the delivery of radio-frequency or other electromagnetic energy to a target tissue site") having predetermined frequency and electric field characteristics (para [0156]--"Lower electromagnetic frequencies such as RF frequencies (e.g. 1 kHz to 1 MHZ) produce a more localized energy concentration (e.g. current density); and generating a power loss density profile wherein the power loss density profile has a peak power loss density in a region of the target tissue layer (para [0147]--"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode").

As per claim 15, Pearson teaches a method of generating a temperature profile in tissue wherein the temperature profile has a peak in a target tissue layer (para [0155]--"In an embodiment, the sensor can be selected to measure temperature...a feedback signal from a temperature sensor or temperature calculation device...determines that a desired cell necrosis temperature is exceeded, then an appropriate signal is sent to the controller which then regulates the amount of electromagnetic energy delivered to the electrodes"), wherein the target tissue layer is below a first tissue layer, the first tissue layer being adjacent to a skin surface (para [0197]-"Embodiments of the invention can be configured for the treatment of tumor and tissue masses at or beneath a tissue surface in a number of organs"--skin is a tissue), the method comprising the steps of: irradiating the target tissue layer and the first tissue layer through the skin surface with electromagnetic energy (para [0004]--"An embodiment of the invention provides an impedance controlled tissue ablation apparatus and method that utilizes impedance determinations, such as localized tissue impedance to optimize the delivery of radio-frequency or other electromagnetic energy to a target tissue site") having predetermined frequency and electric field characteristics (para-[0156]--"Lower electromagnetic frequencies such as RF frequencies (e.g. 1 kHz to 1 MHZ) produce a more localized energy concentration (e.g. current density); and generating a power loss density profile wherein the power loss density profile has a peak power loss density in a region of the target tissue layer (para [0147]--"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode").

layer (para [0147]"various embodiments of the invention can be configured to optimizetarget tissue current density including current density gradients as a function of distance from the electrode").

Supplemental Box

In case the space in any of the preceding boxes is not sufficient.

Continuation of: Box V(2) Citations and explanations:

As per claim 16, Pearson teaches a method of generating a temperature profile in tissue in the absence of cooling wherein the temperature profile has a peak in a target tissue layer (para [0155]--"In an embodiment, the sensor can be selected to measure temperature...a feedback signal from a temperature sensor or temperature calculation device...determines that a desired cell necrosis temperature is exceeded, then an appropriate signal is sent to the controller which then regulates the amount of electromagnetic energy delivered to the electrodes"), wherein the target tissue layer is below a first tissue layer, the first tissue layer being adjacent to a skin surface (para [0197]--"Embodiments of the invention can be configured for the treatment of tumor and tissue masses at or beneath a tissue surface in a number of organs"--skin is a tissue), the method comprising the steps of: irradiating the target tissue layer and the first tissue layer through the skin surface with electromagnetic energy (para [0004]--"An embodiment of the invention provides an impedance controlled tissue ablation apparatus and method that utilizes impedance determinations, such as localized tissue impedance to optimize the delivery of radio-frequency or other electromagnetic energy to a target tissue site") having predetermined frequency and electric field characteristics (para [0156]--"Lower electromagnetic frequencies such as RF frequencies (e.g. 1 kHz to 1 MHZ) produce a more localized energy concentration (e.g. current density); and generating a power loss density profile wherein the power loss density profile has a peak power loss density in a region of the target tissue layer (para [0147]--"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode").

As per claim 17, Pearson teaches a method of creating a lesion in a first layer of tissue (para [0156]--"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue"), the first layer having an upper portion adjacent an external surface of the skin and a lower portion adjacent a second layer of the skin (para [0197]--"Embodiments of the invention can be configured for the treatment of tumor and tissue masses at or beneath a tissue surface in a number of organs"—skin is a tissue), the method comprising the steps of: exposing the external surface of the skin to microwave energy having a predetermined power, frequency, and electric field orientation (para [0059]--"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue"); generating an energy density profile having a peak in the lower portion of the first layer (para [0147]--"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the

continuing to expose the external surface of the skin to the microwave energy for a time sufficient to create a lesion, wherein the lesion begins in the peak energy density region (para [0156]--"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue"; [0147]-"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode").

As per claim 20, Pearson teaches a method of creating a lesion in a dermal layer of the skin, the dermal layer having an upper portion adjacent an external surface of the skin and a lower portion adjacent a subdermal layer of the skin (para [0156]--"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue"), the method comprising the steps of: exposing the external surface to microwave energy having a predetermined power, frequency, and electric field orientation (para [0059]... "various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue"); generating a peak energy density region in the lower portion of the dermal layer (para [0147]--"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode"); and continuing to radiate the skin with the microwave energy for a time sufficient to create a lesion, wherein the lesion begins in the peak energy density region (para [0156]--"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue"; [0147]--"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode").

As per claim 23, Pearson teaches a method of heating a tissue structure located in or near a target tissue layer (para [0059]--"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue"), wherein the target tissue layer is below a first tissue layer, the first tissue layer being adjacent a skin surface (para [0197]--"Embodiments of the invention can be configured for the treatment of tumor and tissue masses at or beneath a tissue surface in a number of organs"-skin is a tissue), the method comprising the steps of:

irradiating the target tissue layer and the first tissue layer through the skin surface with electromagnetic energy (para [0004]--"An embodiment of the invention provides an impedance controlled tissue ablation apparatus and method that utilizes impedance determinations, such as localized tissue impedance to optimize the delivery of radio-frequency or other electromagnetic energy to a target tissue site") having predetermined frequency and electric field characteristics (para [0156]--"Lower electromagnetic frequencies such as RF frequencies (e.g. 1 kHz to 1 MHZ) produce a more localized energy concentration (e.g. current density); and generating a power loss density profile wherein the power loss density profile has a peak power loss density in a region of the target tissue layer (para [0147]--"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode").

-----PLEASE SEE SUPPLEMENTAL BOX-----PLEASE SEE SUPPLEMENTAL BOX------

WRITTEN OPINION OF THE INTERNATIONAL SEARCHING AUTHORITY

International application No. PCT/US 08/60922

Supplemental Box

In case the space in any of the preceding boxes is not sufficient.

Continuation of: Box V(2) Citations and explanations:

As per claim 24, Pearson teaches a method of raising the temperature of at least a portion of a tissue structure (para [0059]--"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue") located below an interface between a dermal layer and subdermal layer in skin, the dermal layer having an upper portion adjacent an external surface of the skin and a lower portion adjacent a subdermal region of the skin, the method comprising the steps of:

irradiating the skin with microwave energy having a predetermined power, frequency and e-field orientation (para [0059]--"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue");

generating a peak energy density region in the lower portion of the dermal layer (para [0147]--"various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode"); initiating a lesion in the peak energy density region by dielectric heating of tissue in the peak energy density region (para [0156]--"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue");

enlarging the lesion, wherein the lesion is enlarged, at least in part, by conduction of heat from the peak energy density region to surrounding tissue (para [0156]--"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue");

removing heat from the skin surface and at least a portion of the upper portion of the dermal layer (para [0155]--"In an embodiment, the sensor can be selected to measure temperature...a feedback signal from a temperature sensor or temperature calculation device...determines that a desired cell necrosis temperature is exceeded, then an appropriate signal is sent to the controller which then regulates the amount of electromagnetic energy delivered to the electrodes"); and

continuing to radiate the skin with the microwave energy for a time sufficient to extend the lesion past the interface and into the subdermal layer (para [0156]--"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue").

As per claim 26, Pearson teaches a method of controlling the application of microwave energy to tissue (para [0059]--"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue"), the method comprising the steps of: generating a microwave signal having predetermined characteristics (para [0059]—"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid

but only in the affected tissue with minimal or no changes to the surrounding tissue"); applying the microwave energy to tissue, through a microwave antenna and a tissue interface operably connected to the microwave antenna (para [0053]--""Electrode", "resilient member" and "antenna" are interchangable and refer to a needle or wire for conducting energy to a tissue site"; [0124]--"a microwave power source coupled to a microwave antenna providing microwave energy"; [0146]--"interface between the patients skin and a ground pad or return electrode coupled the RF generators");

supplying a vacuum pressure to the tissue interface (para [0114]--"Tissue aspiration/collection devices 26 can include syringes, vacuum sources"; [0150]--"Alternatively, the fluid delivery device can be coupled to a vacuum source or otherwise be configured to apply negative pressure to suction off fluid from the target tissue into the lumen(s) of the electrode or lumen(s) of the introducer"); and supplying cooling fluid to the tissue interface (para [0114]--"In various embodiments, ports can be configured for...the delivery of cooling...fluids (both liquid and gas) described herein").

Claim 6 lacks an inventive step under PCT Article 33(3) as being obvious over Pearson

As per claim 6, Pearson teaches the microwave energy application system of claim 1, as above, and further teaches wherein the controller is configured such that the system delivers energy such that a peak power loss density profile is created in the second layer (para [0147]-'various embodiments of the invention can be configured to optimize...target tissue current density including current density gradients as a function of distance from the electrode"). Although Pearson does not specifically teach wherein the tissue comprises a first layer and a second layer, the second layer below the first layer, Pearson does not specifically teach wherein a component of the system can penetrate tissue, therefore accessing the vertical layers of the tissue (para [0072]--"The electrode distal end may be sufficiently sharp to penetrate tissue including fibrous and/or encapsulated tumor masses, bone, cartilage and muscle"). Accordingly, it would have been obvious to one skilled in the art, without undue experimentation, to utilize the teachings of Pearson to derive wherein the tissue comprises a first layer and a second layer, the second layer below the first layer.

Claims 2-4, 7-10, and 27 lack an inventive step under PCT Article 33(3) as being obvious over Pearson, in view of US 2004/0143250 A1

As per claim 2, Pearson teaches the microwave energy application system of claim 1, as above. However, Pearson does not specifically teach wherein the microwave signal has a frequency in the range of between about 4 GHz and about 10 GHz. Trembly teaches wherein the microwave signal has a frequency in the range of between about 4 GHz and about 10 GHz (para [0034]--"the term "microwave" is intended to encompass radiant electrical energy oscillating at frequencies ranging from about 100 MHz to about 10 GigaHz"). It would have been obvious to one of skill in the art to combine the microwave signal frequency of Trembly to the system of Pearson because both Pearson and Trembly teach the use of microwave energy for tissue treatment. Further, Pearson teaches the use of microwave energy in the GHz range (para [0124]--"providing microwave energy in the frequency range from about 915 MHz to about 2.45 GHz"), while Trembly teaches the specific GHz range as claimed. . -----PLEASE SEE SUPPLEMENTAL BOX------

PCT/US 08/60922

Supplemental Box

In case the space in any of the preceding boxes is not sufficient.

Continuation of: Box V(2) Citations and explanations:

As per claim 3, Pearson and Trembly teach the microwave energy application system of claim 2, as above, and Trembly further teaches wherein the microwave signal has a frequency in the range of between about 5 GHz and about 6.5 GHz (para [0034]--"the term "microwave" is intended to encompass radiant electrical energy oscillating at frequencies ranging from about 100 MHz to about 10

As per claim 4, Pearson and Trembly teach the microwave energy application system of claim 3, as above, and Trembly further teaches wherein the microwave signal has a frequency of about 5.8 GHz (para [0034]--"the term "microwave" is intended to encompass radiant electrical energy oscillating at frequencies ranging from about 100 MHz to about 10 GigaHz").

As per claim 7, Pearson teaches an apparatus for delivering microwave energy to target tissue (para [0059]--"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue"), the apparatus comprising: a tissue interface (para [0146]--"interface between the patients skin and a ground pad or return electrode coupled the RF generators"); a microwave energy delivery device (para [0124]--"a microwave power source coupled to a microwave antenna providing microwave energy"; and a cooling fluid positioned between the cooling element and the microwave delivery device (para [0114]--"In various embodiments, ports can be configured for...the delivery of cooling...fluids (both liquid and gas) described herein").

However, Pearson does not specifically teach a cooling element positioned between the tissue interface and the microwave energy device the cooling element comprising a cooling plate positioned at the tissue interface; the cooling fluid having a dielectric constant greater than a dielectric constant of the cooling element. Trembly teaches a cooling element positioned between the tissue interface and the microwave energy device, the cooling element comprising a cooling plate positioned at the tissue interface (para [0019]--"A cooling system may be configured to cool the applicator during keratoplasty operations without flowing coolant beneath the bottom surface 116. For example, the cooling system may comprise a Peltier effect or thermoelectric cooling device"); the cooling fluid having a dielectric constant greater than a dielectric constant of the cooling element. It would have been obvious to one of skill in the art to combine the cooling element having a cooling plate of Trembly to the system of Pearson because both Pearson (para [0114]) and Trembly (para [0019]) teach cooling tissue treated by microwave energy.

As per claim 8, Pearson teaches an apparatus for delivering microwave energy to a target region in tissue (para [0059]--"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue"), the apparatus comprising: a tissue interface having a tissue acquisition chamber (para [0114]---"Tissue aspiration/collection devices 26 can include syringes, vacuum sources coupled to a filter or collection chamber/bag"); and a microwave energy delivery device having a microwave antenna (para [0053]--""Electrode", "resilient member" and "antenna" are interchangable and refer to a needle or wire for conducting energy to a tissue site"; [0124]--"a microwave power source coupled to a microwave antenna providing microwave energy"; [0146]--"interface between the patients skin and a ground pad or return electrode coupled the RF generators").

However, Pearson does not specifically teach a cooling element having a cooling plate. Trembly teaches a cooling element having a cooling plate (para [0019]--"A cooling system may be configured to cool the applicator during keratoplasty operations without flowing coolant beneath the bottom surface 116. For example, the cooling system may comprise a Peltier effect or thermoelectric cooling device"). It would have been obvious to one of skill in the art to combine the cooling element having a cooling plate of Trembly to the system of Pearson because both Pearson (para [0114]) and Trembly (para [0019]) teach cooling tissue treated by microwave energy.

As per claim 9, Pearson teaches an apparatus for delivering microwave energy to a target region in tissue (para [0059]--"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue"), the apparatus comprising: a vacuum chamber adapted to elevate tissue including the target region (para [0114]--"Tissue aspiration/collection devices 26 can include syringes, vacuum sources coupled to a filter or collection chamber/bag") and bring the tissue into contact with a [coolant], adapted to contact a skin surface above the target region, cool the skin surface (para [0114]--"In various embodiments, ports can be configured for...the delivery of cooling...fluids (both liquid and gas); and a microwave antenna configured to deliver sufficient energy to the target region to create a thermal effect (para [0053]--"Electrode", "resilient member" and "antenna" are interchangable and refer to a needle or wire for conducting energy to a tissue stile"; [0124]--"a microwave power source coupled to a microwave antenna providing microwave energy"; [0146]--"interface between the patients skin and a ground pad or return electrode coupled the RF generators").

However, Pearson does not specifically teach a cooling plate and physically separate the skin tissue from the microwave energy delivery device. Trembly teaches a cooling plate (para [0019]--"A cooling system may be configured to cool the applicator during keratoplasty operations without flowing coolant beneath the bottom surface 116. For example, the cooling system may comprise a Peltier effect or thermoelectric cooling device") and physically separate the skin tissue from the microwave energy delivery device (para [0045]--"a bottom dielectric layer 318 may protect cornea 302 from deleterious temperature effects of electrical conduction current that, otherwise, would flow into cornea 302 from the tubes 306 and 308. The bottom dielectric layer 318 may separate bottom surface 304 from cornea 302. The dielectric layer 318 may be thin enough to minimize interference with microwave emissions and thick enough to prevent superficial deposition of electrical energy by flow of conduction current"). It would have been obvious to one of skill in the art to combine the cooling plate of Trembly to the system of Pearson because both Pearson (para [0114]) and Trembly (para [0019]) teach cooling tissue treated by microwave energy, and separating layers would provide a more effective means to protect adjacent tissue from ablation.

Box V(2) Citations and explanations:

As per claim 10, Pearson teaches a system for coupling microwave energy into tissue (para [0059]--"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue"), the system comprising: a microwave antenna (para [0053]--""Electrode", "resilient member" and "antenna" are interchangable and refer to a needle or wire for conducting energy to a tissue site"; [0124]--"a microwave power source coupled to a microwave antenna providing microwave energy"; [0146]--"interface between the patients skin and a ground pad or return electrode coupled the RF generators"); a fluid chamber positioned between the microwave antenna and the tissue (para [0053]--""Electrode", "resilient member" and "antenna" are interchangable and refer to a needle or wire for conducting energy to a tissue site"; [0124]--"a microwave power source coupled to a microwave antenna providing microwave energy"; [0146]--"interface between the patients skin and a ground pad or return electrode

However, Pearson does not specifically teach a cooling plate. Trembly teaches a cooling plate (para [0019]--"A cooling system may be configured to cool the applicator during keratoplasty operations without flowing coolant beneath the bottom surface 116. For example, the cooling system may comprise a Peltier effect or thermoelectric cooling device"). It would have been obvious to one of skill in the art to combine the cooling plate of Trembly to the system of Pearson because both Pearson (para [0114]) and Trembly (para [0019]) teach cooling tissue treated by microwave energy.

As per claim 27, Pearson teaches a method of positioning tissue prior to treating the tissue using radiated electromagnetic energy, the method comprising:

positioning a tissue interface adjacent a skin surface (para [0058]);

engaging the skin surface in a tissue chamber of the tissue interface (para [0114]--"Tissue aspiration/collection devices 26 can include syringes, vacuum sources coupled to a filter or collection chamber/bag"); and

holding the skin surface in the tissue chamber (para [0114]--"Tissue aspiration/collection devices 26 can include syringes, vacuum sources coupled to a filter or collection chamber/bag").

However, Pearson does not specifically teach substantially separating a layer comprising at least one layer of the skin from a muscle layer below the skin. Trembly does teach substantially separating a layer comprising at least one layer of the skin from a muscle layer below the skin (para [0045]--"a bottom dielectric layer 318 may protect cornea 302 from deleterious temperature effects of electrical conduction current that, otherwise, would flow into cornea 302 from the tubes 306 and 308. The bottom dielectric layer 318 may separate bottom surface 304 from cornea 302. The dielectric layer 318 may be thin enough to minimize interference with microwave emissions and thick enough to prevent superficial deposition of electrical energy by flow of conduction current"). It would have been obvious to one of skill in the art to combine the cooling plate of Trembly to the system of Pearson because both Pearson (para [0114]) and Trembly (para [0019]) teach cooling tissue treated by microwave energy, and separating layers would provide a more effective means to protect adjacent tissue from ablation.

Claims 18, 19, 21, 22, and 25 lack an inventive step under PCT Article 33(3) as being obvious over Pearson, in view of US 4,378,806 A (Henley-Cohn).

As per claim 18, Pearson teaches a method of creating a lesion in the skin wherein the skin has at least an external surface, a first layer below the external surface and a second layer (para [0156]--"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue"), the

method comprising the steps of: positioning a device adapted to radiate electromagnetic energy adjacent the external surface (para [0004]--"An embodiment of the invention provides an impedance controlled tissue ablation apparatus and method that utilizes impedance determinations, such as localized tissue impedance to optimize the delivery of radio-frequency or other electromagnetic energy to a target tissue site"); radiating electromagnetic energy from the device (para [0004]--"An embodiment of the invention provides an impedance controlled tissue ablation apparatus and method that utilizes impedance determinations, such as localized tissue impedance to optimize the delivery of radio-frequency or other electromagnetic energy to a target tissue site"), the microwave energy having an electric field component which is substantially parallel to a region of the external surface (para [0083].-."the alternative conductive pathway can share one or more points in common with the original pathway or be parallel with the original pathway but offset a selectable lateral distance"; [0087]--"impedance sensing members 22m can be arranged in arrays 22a having a variety of geometric arrangements and relationships so as to electrically sample different volumes of tissue 5sv using different conductive pathways").

However, Pearson does not specifically teach generating a standing wave pattern in the first layer, the standing wave pattern having a constructive interference peak in the first layer, wherein a distance from the constructive interference peak to the skin surface is greater than a distance from the constructive interference peak to an interface between the first layer and the second layer. Henley-Cohn does teach generating a standing wave pattern in the first layer, the standing wave pattern having a constructive interference peak in the first layer, wherein a distance from the constructive interference peak to the skin surface is greater than a distance from the constructive interference peak to an interface between the first layer and the second layer (col. 4, ln 66 - col. 5, ln 11). It would have been obvious to one of skill in the art to combine the standing wave pattern of Henley-Cohn to the system of Pearson to provide an apparatus for treating tissue using microwave energy that preferentially heats a target site (ie: tumor), "without an adverse effect on tissue surround the tumor, as taught by Henley-Cohn (col. 5, ln 10-11).

WRITTEN OPINION OF THE INTERNATIONAL SEARCHING AUTHORITY

International application No. PCT/US 08/60922

Supplemental Box

In case the space in any of the preceding boxes is not sufficient.

Continuation of: Box V(2) Citations and explanations:

However, Pearson does not specifically teach generating a standing wave pattern in the first layer, the standing wave pattern having a constructive interference peak in the first layer, wherein a distance from the constructive interference peak to the skin surface is greater than a distance from the constructive interference peak to an interface between the first layer and the second layer. Henley-Cohn does teach generating a standing wave pattern in the first layer, the standing wave pattern having a constructive interference peak in the first layer, wherein a distance from the constructive interference peak to the skin surface is greater than a distance from the constructive interference peak to an interface between the first layer and the second layer (col. 4, ln 66 - col. 5, ln 11). It would have been obvious to one of skill in the art to combine the standing wave pattern of Henley-Cohn to the system of Pearson to provide an apparatus for treating tissue using microwave energy that preferentially heats a target site (ie: tumor), "without an adverse effect on tissue surround the tumor, as taught by Henley-Cohn (col. 5, In 10-11).

As per claim 25, Pearson teaches a method of raising the temperature of at least a portion of a tissue structure (para [0059]---"various aspects of the invention is particularly beneficial for use in the treatment of tumors and tumorous tissue by ablative therapies such as RF, microwave, laser and chemical ablation. These and related ablative therapies causes disruption of cell membranes resulting in impedance change in the interstitial fluid but only in the affected tissue with minimal or no changes to the surrounding tissue") located below an interface between a dermal layer and a subdermal layer of skin, wherein the dermal layer has an upper portion adjacent an external surface of the skin and a lower portion adjacent a subdermal region of the skin, the method comprising the steps of positioning a device adapted to radiate microwave energy adjacent the external surface of the skin (para [0004]--"An embodiment of the invention provides an impedance controlled tissue ablation apparatus and method that utilizes impedance determinations, such as localized tissue impedance to optimize the delivery of radio-frequency or other electromagnetic energy to a target tissue site"); radiating microwave energy having an electric field component which is substantially parallel to a region of the external surface above the dermal layer (para [0083]--"the alternative conductive pathway can share one or more points in common with the original pathway or be parallel with the original pathway but offset a selectable lateral distance"; [0087]--"impedance sensing members 22m can be arranged in arrays 22a having a variety of geometric arrangements and relationships so as to electrically sample different volumes of tissue 5sv using different conductive pathways");

creating a lesion in the lower portion of the dermal region by heating tissue in the lower portion of the dermal region using the radiated microwave energy (para [0156]--"these and related embodiments provide the benefit of allowing the size, position and shape of the lesion to be precisely controlled and/or titrated in order to meet the therapeutic needs of the target tissue");

removing heat from the skin surface and at least a portion of the upper portion of the dermal layer to prevent the lesion from spreading into the upper portion of the dermal layer (para [0155]--"In an embodiment, the sensor can be selected to measure temperature... a feedback signal from a temperature sensor or temperature calculation device...determines that a desired cell necrosis temperature is exceeded, there an appropriate signal is sent to the controller which then regulates the amount of electromagnetic energy delivered to the electrodes"); and ceasing the radiating after a first predetermined time, the predetermined time being sufficient to raise the temperature of the tissue structure (para [0175]--"with the use of sensor 324 and feedback control system 329, tissue adjacent to RF electrodes 314 and 316 can be maintained at a desired temperature for a selected period of time without causing a shut down of the power circuit to electrode 314 due to the development of excessive electrical impedance at electrode 314 or adjacent tissue").

However, Pearson does not specifically teach wherein the microwave energy has a frequency which generates a standing wave pattern in the dermal layer, the standing wave pattern having a constructive interference peak in the lower portion of the dermal layer. Henley-Cohn does teach wherein the microwave energy has a frequency which generates a standing wave pattern in the dermal layer, the standing wave pattern having a constructive interference peak in the lower portion of the dermal layer (col. 4, ln 66 - col. 5, ln 11). It would have been obvious to one of skill in the art to combine the standing wave pattern of Henley-Cohn to the system of Pearson to provide an apparatus for treating tissue using microwave energy that preferentially heats a target site (ie: tumor), "without an adverse effect on tissue surround the tumor," as taught by Henley-Cohn (col. 5, in 10-11).

Claims 1-27 have industrial applicability as defined by PCT Article 33(4) because the subject matter can be made or used in industry.
